

COMPASS

COMPASS is a “total package”, a powerful enterprise-wide software platform for utilities.

Customers use the interval data processed by COMPASS to successfully operate, negotiate and compete in the dynamic energy marketplace.

FirstPoint designed and built COMPASS to meet the needs of today’s regulated and deregulated utilities, and to supply the marketplace with customizable, cost-efficient interval data processing.

Custom retrofits are designed into the COMPASS system for individual utilities, allowing them to fully integrate consumption data with their billing, engineering, load management, resource planning, customer service and revenue generation functions and objectives. Customers’ IT departments save years of development time and hundreds of thousands of dollars by implementing the COMPASS system, installed on-site by FirstPoint.

The COMPASS software and server automatically gather raw meter reads from virtually any utility meter, submeter or other pulse-generating device via the industry’s well-known head-end applications. One dependable source of data is created as the information is validated and estimated to meet billing and settlement standards and regulatory requirements.

Data is translated into workable information that is accessible to all departments of the utility as well as to their marketers, outsource providers, and end-use customers. In other words, COMPASS allows our customers and our company to do what we all do best.
